

## Ambulance Case Manager

Easykey is a tool capable of extracting Claims information from various Healthcare Provider websites. It prevents you from manually logging in to the website and spending hours in checking the status on slow unresponsive websites. This tool then enters information into various backend PM systems via screen and desktop auto. It also gives you an advanced reporting console to look at precisely the information you are trying to retrieve.

### Overview

Healthcare Web Development

#### Technology Used

### Problem

An EMS Company made an alliance with a software company based out of South Carolina. They wanted to build an app for the documentation of the cases on ambulances from the scene. They had been using paper till then making it hard to send the information back into the EMR system.

### Solutions

We built a hybrid app capable of running on iOS and Android devices. The app used both Nemesis v2.0 and v3.0 protocols to communicate with the EMR system. The store and forward function allowed the iPad to document the cases from anywhere irrespective of internet connectivity.

### Results

The app was built and functional however due to inability of being able to work with the government agencies, the app was shelved. The liaison could not be set up to get them to send medical transportation requests to ambulances.

Thanks for watching!
