

## Construction Management System

This system helps you in making your workforce more productive so that they spend more time working and less time documenting or finding information. It helps you improve construction quality & safety, reduce rework and improve office to field communication like never before.

### Overview

Web Development    Mobile Development

#### Technology Used

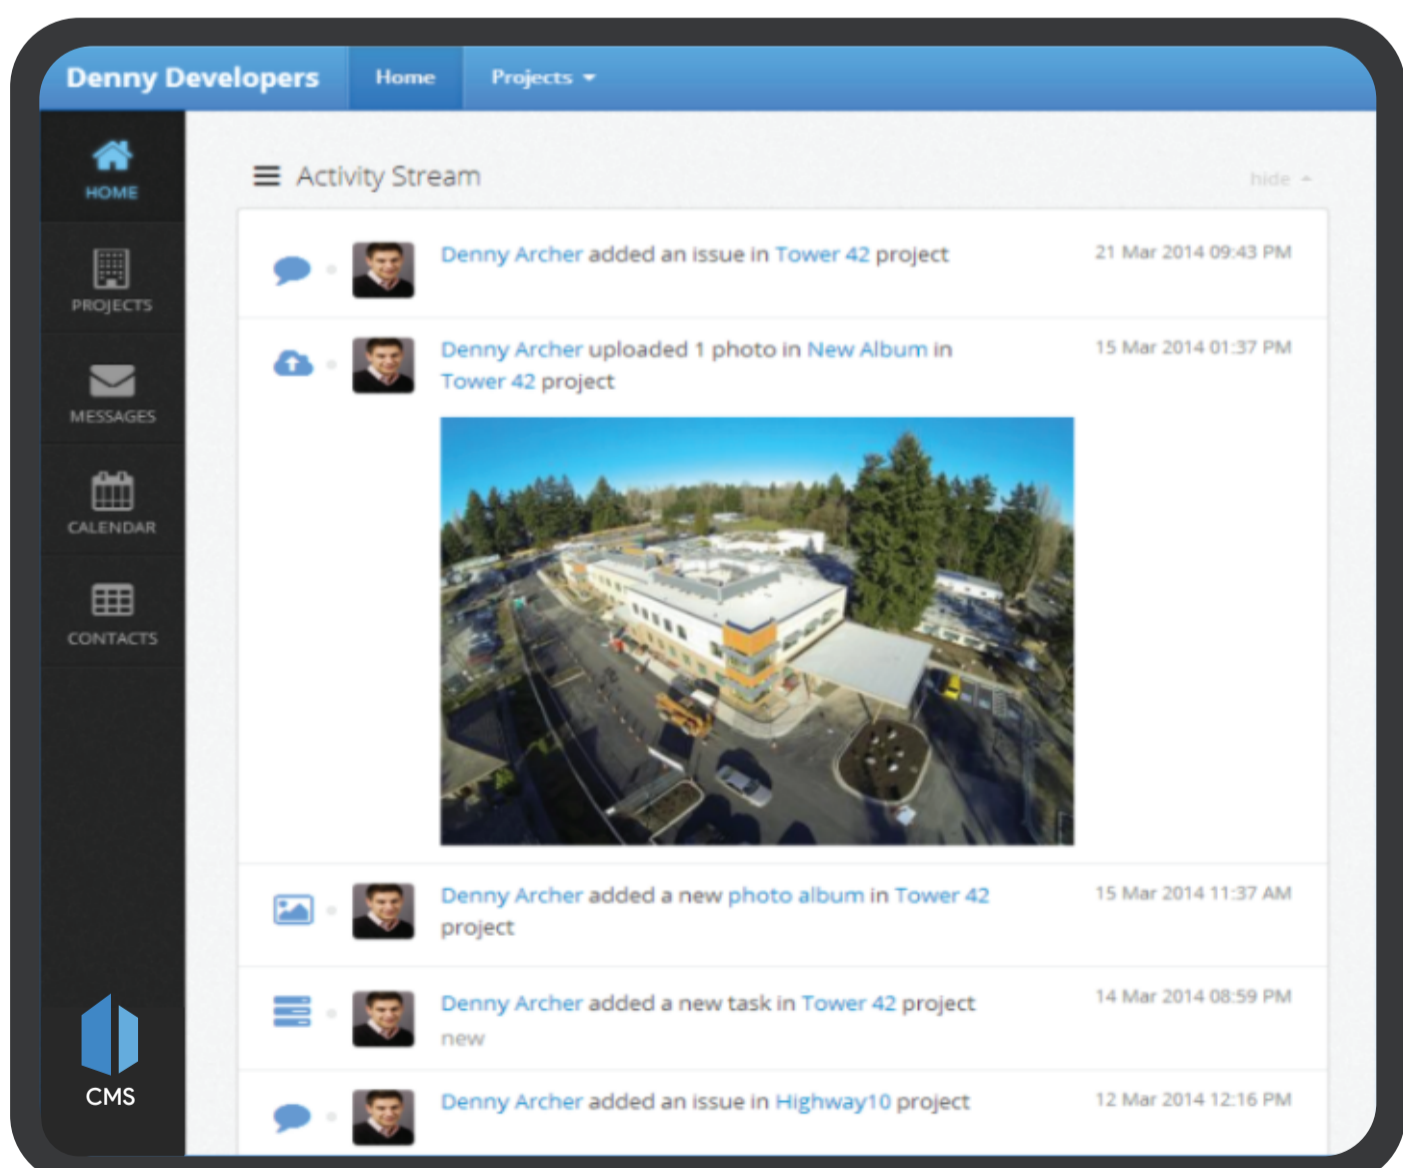

### Problem

Construction Management has been a very poorly designed software and the client wanted to have a great collaboration tool, yet make it easy for the people working from the Foreman to the Project Manager. It was required to build the solution to cater to all the needed of various construction companies and allow construction workers to work freely across sites and locations.

### Solutions

We built a cloud based application using AWS with all the important features to ensure that costing is kept low yet the customers get the best in the class user experience. We fused the concepts of lean construction, look ahead planning, submittals, transmittals and a lot of other necessary features.

### Results

The app was quickly adopted across the construction industry with people lauding the owners of the IP of the Product. They had a successful start up that skyrocketed to a huge company giving a run to the likes of Primavera and a lot of large players. We got recognition from the entire construction industry for our outstanding contribution.

Thanks for watching!
